

***“Next Generation Fiscal Reform Frameworks to deliver effective counter-cyclical policy: Indian and International Experiences”***

Goa, India – 12-13 December 2014

# **The impact of national fiscal rules on the stabilization function of fiscal policy**

**Agnese Sacchi**

*Universitas Mercatorum (Italy) and  
Governance and Economics research Network (Spain)*

[a.sacchi@unimercatorum.it](mailto:a.sacchi@unimercatorum.it)

**Simone Salotti**

*Oxford Brookes University (UK)*

[ssalotti@brookes.ac.uk](mailto:ssalotti@brookes.ac.uk)

# Rationale

---

- **Large deficits** in **industrialized economies** and the **sovereign debt crisis** in the euro area → *attempts to increase fiscal discipline* (Spilimbergo et al. 2008; Hauptmeier et al. 2011).
- **How?** *Adoption of fiscal rules to reduce:* deficit bias, political failures, and the discretion of governments (Debrun et al. 2008; Kumar et al. 2009; Cottarelli & Schaechter 2010; European Commission 2011).
- **But...** *Running balanced-budgets is not valuable per se but it matters for what it implies for other macroeconomic targets, i.e. macroeconomic stabilization.*
- **Adverse welfare and economic growth effects of macroeconomic volatility** (i.e. *output and inflation*).

# This paper ...

---

- *aims* at understanding if **national fiscal rules** affects the effectiveness of the governments' **macroeconomic stabilization function**.
- *analyzes* the relationship between **discretionary fiscal policy** (it would be pointless to study automatic stabilizers, their role is clear) and macroeconomic stability, i.e. **output volatility and inflation volatility**, employing **annual panel** data for **21 OECD countries** over the **1985-2012** period.
- *finds* that:
  - **discretionary fiscal policy** → **higher volatility of output and inflation**.
  - when **strict fiscal rules** are introduced → **discretionary policy** becomes **output-stabilizing** rather than destabilizing.
  - however, **fiscal rules** are **unable** to affect the **inflation-destabilizing** nature of discretionary fiscal policy, if any.

# The related literature 1/2

---

## ○ *Studies on macroeconomic stabilization*

- **Fiscal policy** is better suited for the role of macroeconomic stabilizer (Blinder 2004): automatic stabilizers!
- The **effects of fiscal policy on macroeconomic volatility** (Gali 1994; Fatas & Mihov 2001, 2003; Rother 2004; Badinger 2009) → aggressive use of fiscal policy reduces macroeconomic stability (of output; unclear on inflation volatility).
- The **government's discretionary corrections** of expenditure and/or taxation not taken in response to cyclical developments → **destabilizing impact** on the economy (Furceri 2007; Afonso & Furceri 2008; Loayza et al. 2007).

# The related literature 2/2

---

## ○ *Studies on fiscal rules*

- Most studies focus on their **disciplinary effect**...
- Are rules **effective**? → *Hard to conclude* (Wyplosz 2005, 2011, 2012; Svensson 2005; von Hagen 2006; Guichard et al. 2007; Hallerberg et al. 2007, 2009; Manasse 2007, Debrun et al. 2008; Ljungman 2008; Schick 2010; Lienert 2010; Schaechter et al. 2012).
- There is not much on the rules' influence on the **relationship between fiscal policy and macroeconomic stability** (mostly USA: Bayoumi & Eichengreen 1995; Alesina & Bayoumi 1996; Fatas & Mihov 2006).

# Fiscal rules and macroeconomic stability?

---

- **Hard to understand *a priori*** the way in which such rules will influence the role played by governments for macroeconomic stability.
  - *On the one hand*, national fiscal rules can increase the transparency of the public budget, governments' effectiveness and accountability → **avoid unsustainable fiscal policies** and improve fiscal management → **macroeconomic stability** (Lavigne 2011; Blume & Voigt 2013).
  - *On the other hand*, fiscal rules normally constrain budgetary variables → smaller public sectors; **against** the **tax-smoothing** theory of budget deficits; **lower governments' flexibility** to react → **macroeconomic instability** (Barro 1979; Galí 1994; Alesina & Perotti 1999).

# Our contribution

---

- Estimate **discretionary fiscal policy** using **several alternative measures of government intervention** (narrowly and broadly defined).
- Analyze the relationship between discretionary fiscal policy and macroeconomic volatility with **panel data** (i.e. **three-year periods**) **rather than cross-sectional** data → *as done in most of the existing literature*.
- Then, and most importantly, we study **how this relationship is affected** by the existence of **national fiscal rules**.
- In all cases we control for **potential endogeneity** issues that are widely recognized to affect this type of analysis.

# Results – presentation plan

---

1. How we estimate **discretionary** fiscal policy.
2. **Output volatility – discretionary fiscal policy** model (as in the existing literature).
3. **Output volatility – discretionary fiscal policy** model (enriched **with fiscal rules**, and their interaction with fiscal policy).
4. **Inflation volatility – discretionary fiscal policy** model (as in the existing literature).
5. **Inflation volatility – discretionary fiscal policy** model (enriched **with fiscal rules**, and their interaction with fiscal policy).

# 1. Estimating discretionary fiscal policy

- The stabilizing role of automatic stabilizers is well-known. That is why we need to study **discretionary policy**, and it has to be estimated (standard approach in the literature: Fatas and Mihov 2001, 2003, 2005).

$$\Delta \ln spending_{-t} = \alpha_0 + \alpha_1 \Delta \ln spending_{-t-1} + \alpha_2 \Delta \ln gdp_t + \beta_1 \pi + \beta_2 \pi^2 + trend + \varepsilon_t^{disc\_fp}$$

- **2SLS estimations** for each country of our sample over the period 1961-2012.
- Robustness: three alternative *spending\_* series: **consumption**; **consumption plus investment**; **primary expenditure** (basically: from narrowly-defined to broadly-defined discretionary policy).
- Our measure of discretionary fiscal policy: **standard deviation over three-year periods of the fiscal shocks** just estimated.

## 2. Discretionary fiscal policy and output volatility

1/2

### ○ The standard model

$$\ln \sigma_{i,[t,t+2]}^{gdp} = \phi_1 \text{discr}_{i,[t,t+2]} - \text{fp}_{i,[t,t+2]} + \phi_1 \mathbf{W}_{i,[t,t+2]} + \mu_i + \eta_t + \nu_{i,t}$$

- **Dep. var.** → *standard deviation of the growth rate of real GDP per capita over the three year periods*, standing for **output volatility** (robustness: *private output volatility*).
  - **Main explanatory variable** → *discretionary fiscal policy*
  - **W** → vector of controls including government size, trade openness, log real GDP per capita.
- Sign of  $\phi_1$  indicates whether **discretionary fiscal policy contributes to the output stability** of the countries under observation (i.e.  $\phi_1 < 0$ ).
- **Methodology:** FE with DK standard errors; Sys-GMM estimator.

## 2. Discretionary fiscal policy and output volatility

2/2

*FE-DK*

*sys-GMM*

	Macro volatility: GDP			Macro volatility: GDP		
	<i>discr gpe</i>	<i>discr gci</i>	<i>discr gc</i>	<i>discr gpe</i>	<i>discr gci</i>	<i>discr gc</i>
<i>discr_fp</i>	5.50*** (3.40)	6.66 (1.03)	11.59** (2.11)	9.26 (1.28)	21.1* (1.68)	29.2** (2.32)
<i>gov_size</i>	0.001 (0.04)	0.001 (0.07)	-0.001 (-0.06)	0.015 (0.51)	0.0097 (0.41)	0.018 (0.87)
<i>open</i>	-0.12 (-1.06)	-0.008 (-0.71)	-0.002 (-0.17)	-0.0075 (-0.47)	-0.011 (-0.73)	-0.025* (-1.81)
<i>gdp_level</i>	0.32 (0.91)	0.18 (0.65)	-0.12 (-0.37)	0.77 (1.28)	0.84* (1.72)	0.86* (1.72)

AR(2)				0.99	0.40	0.49
Hansen				0.92	0.96	0.97

- **Positive relationship** as in previous studies → **government spending volatility adversely affects output stability** (a 1% increase in volatility of *discr\_fp* → GDP volatility increase by between 0.10 and 0.19 pp.)

# 3. Discretionary fiscal policy, output volatility, and fiscal rules

1/5

- The effect of fiscal rules (1985-2012)

$$\ln \sigma_{i,[t,t+2]}^{gdp} = \gamma_1 \text{discr\_fp}_{i,[t,t+2]} + \gamma_2 \text{rule}_{-i,[t,t+2]} + \gamma_3 \text{discr\_fp} * \text{rule}_{-i,[t,t+2]} + \mu_1 \mathbf{W}_{i,[t,t+2]} + \mu_i + \eta_t + \nu_{i,t}$$

- **rule** → index from **0 to 5** measuring the extent of fiscal rules; **5 stricter** rules (source IMF: Kinda et al. 2013).
- **Coverage:** *national*, covering at least the central government.
- **Type:**
  - Budget balance (*rule\_bb*)
  - Debt (*rule\_d*)
  - Expenditure (*rule\_e*)
  - Revenue (*rule\_r*)
  - Overall index (*rule\_overall*)
- **FE-DK and Sys-GMM** → to deal with the potential endogeneity of the interaction term between discretionary policy and fiscal rules (*discr\_fp\*rules*).

# 3. Discretionary fiscal policy, output volatility, and fiscal rules

- Discretionary fiscal policy is **output-destabilizing** when **rules** are **not stringent enough** (index < 3); **the opposite** when **rules** (particularly those on balanced budgets) are **stringent!**

# 3. Discretionary fiscal policy, output volatility, and fiscal rules

3/5

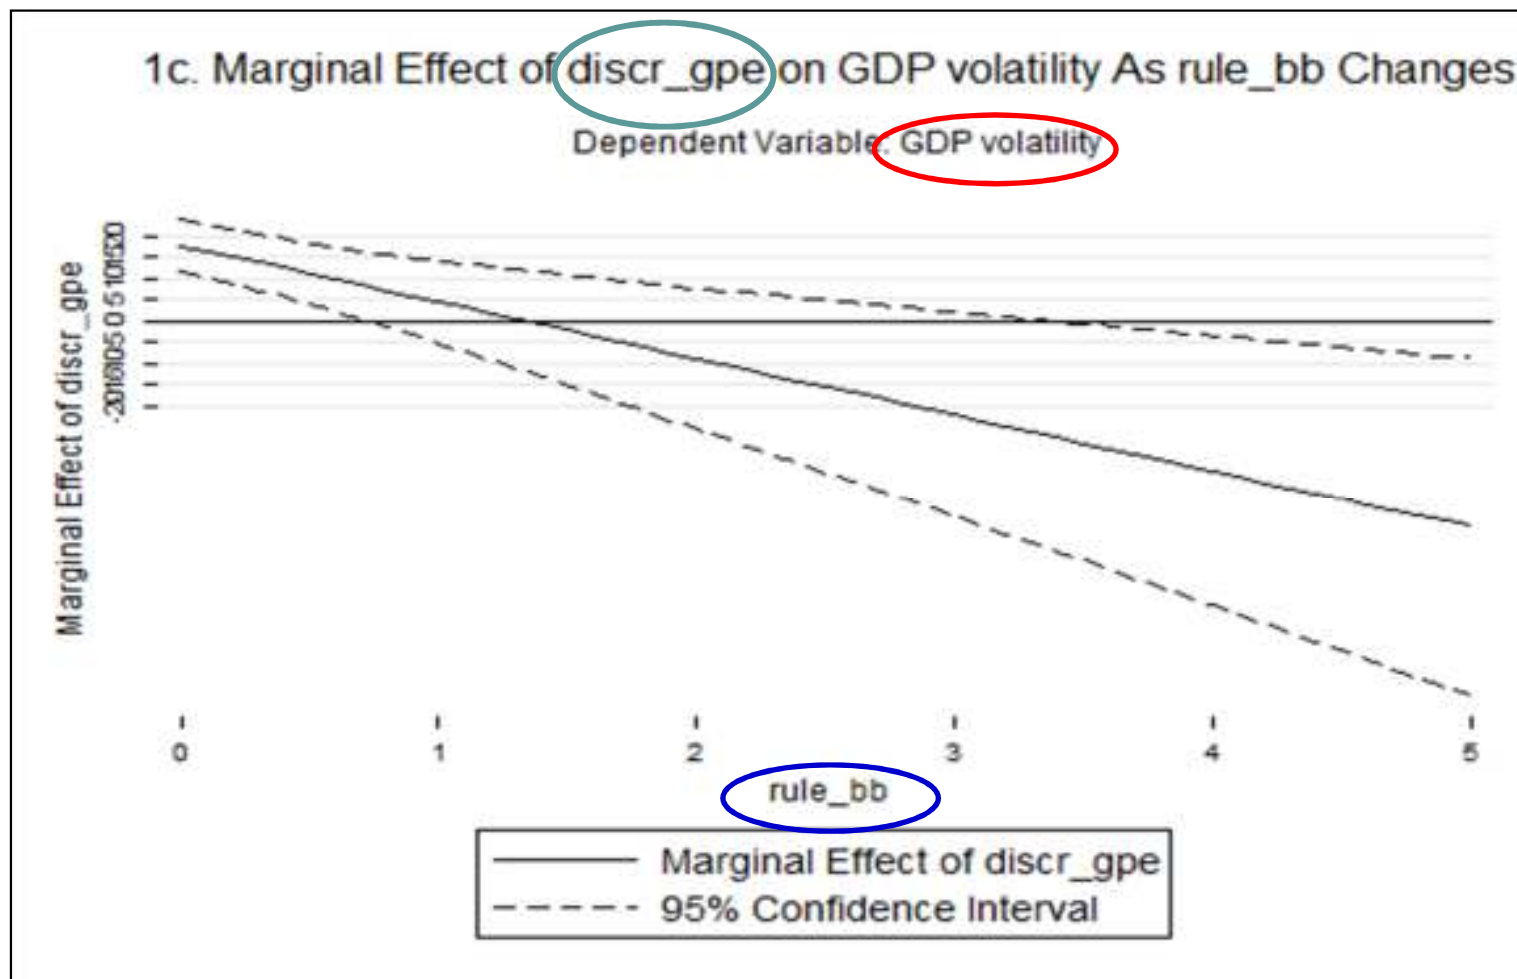

- Results (*discr\_fp* = primary expenditure; expenditure rule)

# 3. Discretionary fiscal policy, output volatility, and fiscal rules

4/5

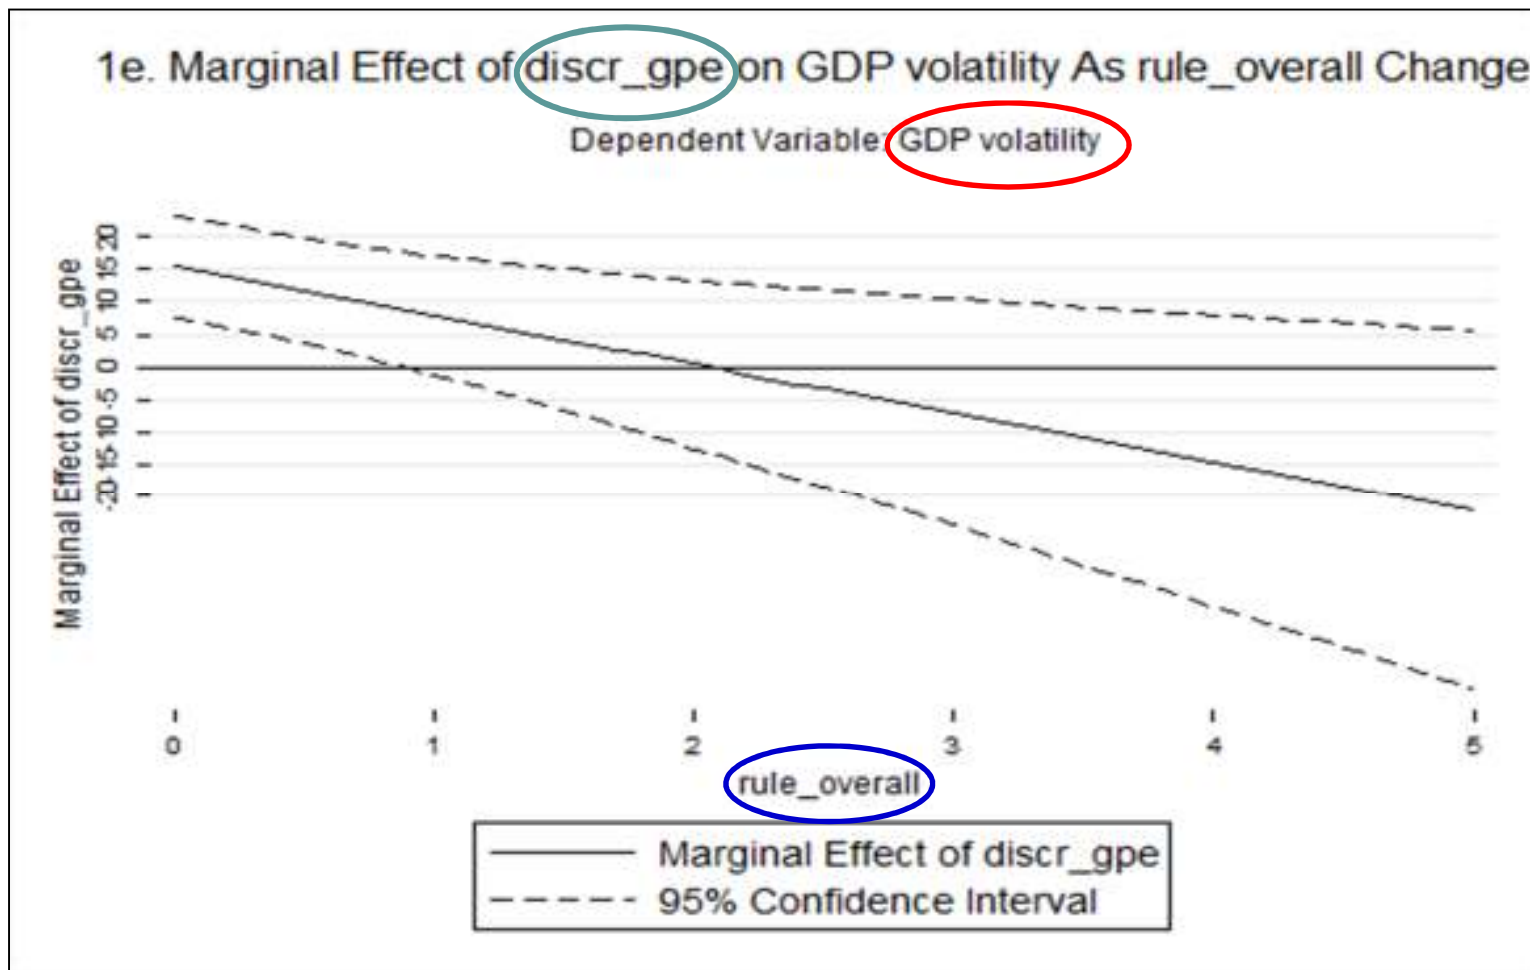

- Results (*discr\_fp* = primary expenditure; budget balance rule)

# 3. Discretionary fiscal policy, output volatility, and fiscal rules

5/5

- Results (*discr\_fp* = primary expenditure; overall rule)

## 4. & 5. Discretionary fiscal policy, inflation volatility, and fiscal rules

---

- **4. Results** from the **standard model** of the literature estimated with panel data:
  - Only weak evidence that **narrowly-defined discretionary** fiscal policy (*i.e. government consumption + investment*) is **inflation-destabilizing**; no effects of broadly-defined policy (*i.e. government primary expenditure*).
- **5. Results** from model enriched **with fiscal rules**:
  - **No role of fiscal rules.**
  - Possible explanation: *inflation management has more to do with **central banks** than governments, the lack of influence of fiscal rules had to be expected!*

# Robustness checks

---

- Estimate **alternative specifications of model (1)** using the following: *primary receipts, net lending, and cyclically-adjusted net lending* → *positive relationship between GDP volatility and discretionary policy.*
- Estimate the **standard model through 2SLS** instead of sys-GMM → *results reassuringly confirm the above findings (i.e. the positive relationship between discretionary fiscal policy and GDP volatility).*
- Estimate the standard model over **4-year and 2-year periods; changing the specific 3-year periods** → *the findings effectively confirm the benchmark results.*

# Discussion and summary

---

- **Output-destabilizing effects** of discretionary expenditure, particular of **public investment** and **government consumption**
  - *Recently, **governments** in the **EU** have focused on **cutting the latter** in order to implement **austerity** measures to improve public finances.*
- When **strict rules** are **implemented**, **discretionary primary expenditure** becomes **output-stabilizing**.
  - *Rules on balanced budgets are more effective in mitigating the output-destabilizing effects of discretionary policy than rules focusing on only expenditure or revenue → **not all types of rules are equally effective.***
- **Discretionary fiscal policy** increases (to a lesser extent) **inflation instability**.
- **Fiscal rules** do not affect the latter relationship.
  - *This seems legitimate, given that the task of maintaining a stable inflation rate is in **the hands of central banks**, rather than governments.*

# Policy implications

---

- **Fiscal rules** always debated for their role in ensuring **fiscal discipline**.
- Our results suggest that **certain types of strict fiscal rules**, particularly if targeting **balanced budgets**, can affect the **stabilization function of fiscal policy**.
- Since there is evidence of **adverse welfare and growth effects of output volatility**, our results may imply a **beneficial role of fiscal rules** unrelated to the disciplinary one, if any.
- This **welfare-enhancing effect of fiscal rules** seems to be particularly relevant given austerity policies negatively affecting economic growth (IMF 2012). Our results suggest that the **existence of rules** guiding the policy-makers behavior may **mitigate those adverse effects**.

# Thank you for your attention!
