

Comparative advantage as a source of exporters'  
pricing power: Evidence from China and India  
by  
Sushanata Mallick and Helena Marques

# Part I

## Summary of the paper

## Objective

- Role of product-level comparative advantage in exchange rate pass through (ERPT) to exporting firms' prices in China and India
- Comparative advantage associated with lower fixed cost and higher market power
- Higher ERPT to export prices if cost effect dominates
- Lower ERPT to export prices if market power effect dominates

# Methodology

- Assumption: Firm-level productivity is a function of product-level Revealed Comparative Advantage (RCA) index and bilateral exchange rate
- Optimal price set by an exporting firm depends on its productivity and hence on product-level comparative advantage and exchange rate
- Panel data set from UN Comtrade consisting of location and product-specific export price data for China and India at 6-digit level
- Product-level RCA index (Hanson, 2012) to proxy comparative advantage

# Main findings

In response to a depreciation of NEER

- Chinese firms reduce yuan prices to gain market share: Fixed cost effect
- Indian firms increase rupee prices (pricing-to market, hence incomplete ERPT): Market power effect

# Part II

## Comments

# Implied homogeneity assumption for firm-productivity

Firm productivity: Function of product-level comparative advantage and bilateral exchange rate

- Homogeneous, **not heterogeneous** productivity across firms exporting a specific product
- Symmetric export price across firms for a specific product
- Product-level ERPT identifiable

# Firm productivity in India function of comparative advantage and exchange rate

- Can firm productivity be explained by comparative advantage and exchange rate in India?
- Are estimates of firm-level productivity based on firm level data support this assumption?

## Effect on volume of exports?

- Higher the pricing to market, lower response of export volume to exchange rate change
- Exploration of this issue would strengthen the story

# Role of imported intermediate inputs (Amiti, Itskhoki, Konings, 2012)

- Large exporters are simultaneously large importers of intermediate inputs
- Depreciation increases variable cost of inputs
- Firms optimally choose to keep mark-up high
- Incomplete ERPT to export prices
- Identification problem of market power channel and imported input cost channel

# Are large exporters also large importers of imported input in India?

- Non-financial manufacturing exporting firms in Prowess
- Spearman rank correlation
  - Exports and imports of raw materials (in real terms)
  - Exports (real) and raw material imports as a share of raw material purchase

# Findings

Full sample

	Rank correlation coefficient
Exports & imports in real terms	0.42***
Exports (real) & raw material imports/purchase	0.21***
No of observations	36574

# Findings

Exporters with exports to sales ratio  $> 30\%$  (value at 75th percentile)

	Rank correlation coefficient
Exports & imports in real terms	<b>0.54***</b>
Exports (real) & raw material imports/purchase	<b>0.27***</b>
No of observations	9246

## Alternative possible explanation for low ERPT

- Incomplete ERPT to Indian export prices due to imported input cost effect
  
- Control for imported input intensity of exporting firms needed

Thank you
