December 4, 2007

## Analyze de-facto integration in EMEs in the presence of frictions

- Analyze de-facto integration in EMEs in the presence of frictions
- Modified market efficiency conditions

- Analyze de-facto integration in EMEs in the presence of frictions
- Modified market efficiency conditions
- How far does CIP hold?
  - Self-Exciting Threshold Autoregressive Model (SETAR)
  - Ordinal Index of de-facto Integration

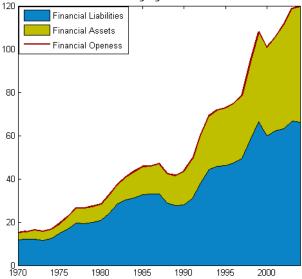

Inform debate over regulation and control. Eg: India

- Inform debate over regulation and control. Eg: India
  - Concerns over fluidity of capital
  - Financial integration has implications for efficacy of domestic fiscal, monetary and exchange rate policies

- Inform debate over regulation and control. Eg: India
  - Concerns over fluidity of capital
  - Financial integration has implications for efficacy of domestic fiscal, monetary and exchange rate policies
- CIP and UIP cornerstones of exchange rate models.

- Inform debate over regulation and control. Eg: India
  - Concerns over fluidity of capital
  - Financial integration has implications for efficacy of domestic fiscal, monetary and exchange rate policies
- CIP and UIP cornerstones of exchange rate models.
- Bulk of research in this area on Industrialized countries (Obstfeld and Taylor (2004), Peel and Taylor(2002), Vieria(2003), Balke and Wohar (1998)).

#### Foreign Assets and Liabilities as % of GDP Emerging Markets

- New markets for forward transactions and financial instruments in EMEs ⇒ New data.
- Chinn (2006) survey, Branson and Taylor (2004) Russia.

▶ < Ξ ▶</p>

- Estimated Thresholds non-trivial, asymmetric.
- Thresholds conform to expectations:
  - Larger negative thresholds for known outflow restrictors (eg. Malaysia).
  - Narrower and enclose more observations for developed markets.
  - Wider during crisis periods.

- Philippines and India most integrated EMEs, Thailand and Malaysia least.
- Consistent with Francis, Hasan and Hunter (2002) results on UIP.

b 4 3 b

- Philippines and India most integrated EMEs, Thailand and Malaysia least.
- Consistent with Francis, Hasan and Hunter (2002) results on UIP.
- Correlation of Integration Index with de-jure index of Chinn-Ito (2006) is high, with Lane-Milesi-Ferretti(2006) is low.

- Philippines and India most integrated EMEs, Thailand and Malaysia least.
- Consistent with Francis, Hasan and Hunter (2002) results on UIP.
- Correlation of Integration Index with de-jure index of Chinn-Ito (2006) is high, with Lane-Milesi-Ferretti(2006) is low.
- Rankings robust to alternative model specifications, estimation methodologies.

In a model world, market efficiency means:

$$\delta_t = P(\frac{F_{t+k} - S_t}{S_t}) - (i_{t+k} - i_{t+k}^*) = 0$$
(1)

Image: A match a ma

With transaction costs, bid and ask rates differ. CIP requires:

$$\delta_p = \frac{F_b - S_a}{S_a} - (i - i^*) \le 0 \tag{2}$$

$$\delta_n = \frac{F_a - S_b}{S_b} - (i - i^*) \ge 0 \tag{3}$$

Complication: Measuring average of Bid and Ask rates

$$\hat{\delta} = \frac{F - S}{S} - (i - i^*)$$

$$\Rightarrow \hat{\delta} = \delta_p + C_1$$
(4)
(5)

< < p>< < p>

 $\exists \rightarrow$ 

where 
$$C_1 = \left(\frac{F_b - S_a}{S_a}\right) \frac{\zeta_S}{2S_a} + \frac{\zeta_F + \zeta_S}{2S_a - \zeta_S}$$
.

 $\exists \rightarrow$ 

Complication: Measuring average of Bid and Ask rates

$$\hat{\delta} = \frac{F - S}{S} - (i - i^*)$$

$$\Rightarrow \hat{\delta} = \delta_p + C_1$$
(4)
(5)

where 
$$C_1 = \left(\frac{F_b - S_a}{S_a}\right) \frac{\zeta_S}{2S_a} + \frac{\zeta_F + \zeta_S}{2S_a - \zeta_S}$$
.

Similarly,

$$\Rightarrow \hat{\delta} = \delta_n - C_2 \tag{6}$$
  
where  $C_2 = \left(\frac{F_a - S_b}{S_b}\right) \frac{\zeta_S}{2S_b} + \frac{\zeta_F + \zeta_S}{2S_b + \zeta_S}.$ 

Image: A math a math

Complication: Measuring average of Bid and Ask rates

$$\hat{\delta} = \frac{F - S}{S} - (i - i^*)$$

$$\Rightarrow \hat{\delta} = \delta_p + C_1$$
(4)
(5)

where 
$$C_1 = \left(\frac{F_b - S_a}{S_a}\right) \frac{\zeta_S}{2S_a} + \frac{\zeta_F + \zeta_S}{2S_a - \zeta_S}$$
.

Similarly,

$$\Rightarrow \hat{\delta} = \delta_n - C_2$$
  
where  $C_2 = \left(\frac{F_a - S_b}{S_b}\right) \frac{\zeta_S}{2S_b} + \frac{\zeta_F + \zeta_S}{2S_b + \zeta_S}.$ 

CIP condition:

 $\delta_p \leq 0 \& \delta_n \geq 0$ 

modifies to:

$$-C_2 \leq \hat{\delta} \leq C_1$$

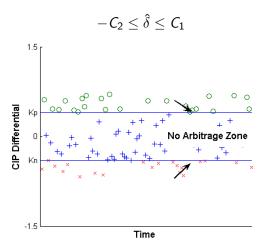

G. Pasricha (UCSC)

A N

3

(6)

3

A (10) > 4

### • Assume a tax $\tau$ on inflows into the EME.

3

イロト イヨト イヨト イヨト

Assume a tax  $\tau$  on inflows into the EME. CIP now requires:

$$i.e.: -C_2 \le \hat{\delta} \le \tau + C_1 \tag{7}$$

Tax on outflows similarly pushes down negative threshold.

Assume a tax  $\tau$  on inflows into the EME. CIP now requires:

$$i.e.: -C_2 \le \hat{\delta} \le \tau + C_1 \tag{7}$$

Tax on outflows similarly pushes down negative threshold.

■ Suppose u% of every USD of inflows to be kept as unremunerated reserves, paid back at time h ≥ 1.

CIP requires:  $-C_2 \leq \hat{\delta} \leq X + C_1$ 

X positive and increases with h and u.

# **1** The no-arbitrage band $[\kappa_n, \kappa_p]$ is larger than the largest spread.

3

- **1** The no-arbitrage band  $[\kappa_n, \kappa_p]$  is larger than the largest spread.
- 2 Bands are wider during crisis periods when spreads are wider.

- **1** The no-arbitrage band  $[\kappa_n, \kappa_p]$  is larger than the largest spread.
- 2 Bands are wider during crisis periods when spreads are wider.
- Thresholds likely to be asymmetric around zero; Larger negative thresholds for currencies that were expected to appreciate or not to depreciate too much.

- **1** The no-arbitrage band  $[\kappa_n, \kappa_p]$  is larger than the largest spread.
- 2 Bands are wider during crisis periods when spreads are wider.
- Thresholds likely to be asymmetric around zero; Larger negative thresholds for currencies that were expected to appreciate or not to depreciate too much.
- Taxes and controls on capital inflows increase positive threshold and vice versa. Effect more pronounced for shorter maturities.

- **1** The no-arbitrage band  $[\kappa_n, \kappa_p]$  is larger than the largest spread.
- 2 Bands are wider during crisis periods when spreads are wider.
- Thresholds likely to be asymmetric around zero; Larger negative thresholds for currencies that were expected to appreciate or not to depreciate too much.
- Taxes and controls on capital inflows increase positive threshold and vice versa. Effect more pronounced for shorter maturities.

Limited supply of capital probably reduces the reversion speed.

# Self-Exciting Threshold Autoregressive Model (SETAR)

$$\delta_t = \rho_i \delta_{t-1} + \epsilon_{it} \qquad \text{for} \quad \kappa_n < \delta_{t-1} < \kappa_p \tag{8}$$

$$\delta_t - \kappa_n = \rho_n (\delta_{t-1} - \kappa_n) + \epsilon_{nt} \quad \text{for} \quad \delta_{t-1} \le \kappa_n \tag{9}$$

$$\delta_t - \kappa_p = \rho_p(\delta_{t-1} - \kappa_p) + \epsilon_{pt} \quad \text{for} \quad \delta_{t-1} \ge \kappa_p \tag{10}$$

where  $\epsilon_{jt} \sim N(0, \sigma_j^2)$ , j = i, n, p;  $\kappa_n$  and  $\kappa_p$  are the negative and positive thresholds respectively.

 Efficient arbitrage hypothesis: AR(1) process outside the bands is stationary.

$$\mathscr{L} = -\frac{1}{2} \sum_{\delta_{t-1} \in (\kappa_1, \kappa_2)} [\ln \sigma_i^2 + \frac{\epsilon_{it}^2}{\sigma_i^2}] - \frac{1}{2} \sum_{\delta_{t-1} \ge \kappa_p} [\ln \sigma_p^2 + \frac{\epsilon_{pt}^2}{\sigma_p^2}] \qquad (11)$$
$$-\frac{1}{2} \sum_{\delta_{t-1} \le \kappa_n} [\ln \sigma_n^2 + \frac{\epsilon_{nt}^2}{\sigma_n^2}]$$

3

-

$$\mathscr{L} = -\frac{1}{2} \sum_{\delta_{t-1} \in (\kappa_1, \kappa_2)} [\ln \sigma_i^2 + \frac{\epsilon_{it}^2}{\sigma_i^2}] - \frac{1}{2} \sum_{\delta_{t-1} \ge \kappa_p} [\ln \sigma_p^2 + \frac{\epsilon_{pt}^2}{\sigma_p^2}] \qquad (11)$$
$$-\frac{1}{2} \sum_{\delta_{t-1} \le \kappa_n} [\ln \sigma_n^2 + \frac{\epsilon_{nt}^2}{\sigma_n^2}]$$

■ Qian(1998) derived n-consistency of ML-estimators.

$$\mathscr{L} = -\frac{1}{2} \sum_{\delta_{t-1} \in (\kappa_1, \kappa_2)} [\ln \sigma_i^2 + \frac{\epsilon_{it}^2}{\sigma_i^2}] - \frac{1}{2} \sum_{\delta_{t-1} \ge \kappa_p} [\ln \sigma_p^2 + \frac{\epsilon_{pt}^2}{\sigma_p^2}] \qquad (11)$$
$$-\frac{1}{2} \sum_{\delta_{t-1} \le \kappa_n} [\ln \sigma_n^2 + \frac{\epsilon_{nt}^2}{\sigma_n^2}]$$

- Qian(1998) derived n-consistency of ML-estimators.
- Tsay(1989) test to test for nonlinearity in the data.

$$\mathscr{L} = -\frac{1}{2} \sum_{\delta_{t-1} \in (\kappa_1, \kappa_2)} [\ln \sigma_i^2 + \frac{\epsilon_{it}^2}{\sigma_i^2}] - \frac{1}{2} \sum_{\delta_{t-1} \ge \kappa_p} [\ln \sigma_p^2 + \frac{\epsilon_{pt}^2}{\sigma_p^2}] \qquad (11)$$
$$-\frac{1}{2} \sum_{\delta_{t-1} \le \kappa_n} [\ln \sigma_n^2 + \frac{\epsilon_{nt}^2}{\sigma_n^2}]$$

- Qian(1998) derived n-consistency of ML-estimators.
- Tsay(1989) test to test for nonlinearity in the data.
- Non-Crisis periods.
