# What makes home bias abate? <br> The evolution of foreign ownership of Indian firms 

Ajay Shah Ila Patnaik

December 3, 2007

## The big facts

1986 First country fund
1992 'FII' framework
2001 Reforms of capital controls and equity market institutions largely complete.
2003 Foreign ownership of shares $\approx \$ 10$ billion
2007 Foreign ownership of shares $\approx \$ 124$ billion
Why?

## Home bias perspective

## March 2001 March 2007

| ICAPM weight of India | 0.42 | 1.53 |
| :--- | :--- | :--- |
| Actual weight of India | 0.04 | 0.24 |
| Home bias metrics |  |  |
| 1 - (actual/ICAPM) | 0.92 | 0.85 |
| ICAPM /actual | 11.8 | 6.47 |

## Potential explanations

- Did India become fashionable?
- Did the firms achieve characteristics that are conducive to internationalisation of liabilities?

## Part I

## Sources of change

## Three sources of change

- Indian market capitalisation goes up, while foreigners preserve their ownership of Indian shares. ("ICAPM effect")
- Changes in insider ownership - for foreigners to buy shares, insiders ("promoters") have to reduce ownership. ("Stulz effect").
- Traditional sources of home bias - information asymmetries, liquidity, etc.

## Accounting for change

$M$ is Indian market cap (in dollars)
$p$ is insider shareholding
$g$ is fraction of outsider shareholding with foreigners
$F$ is dollar value of foreign shareholding.

## Accounting for change

$M$ is Indian market cap (in dollars)
$p$ is insider shareholding
$g$ is fraction of outsider shareholding with foreigners
$F$ is dollar value of foreign shareholding.

$$
F=g(1-p) M
$$

## Accounting for change

$M$ is Indian market cap (in dollars)
$p$ is insider shareholding
$g$ is fraction of outsider shareholding with foreigners
$F$ is dollar value of foreign shareholding.

$$
\begin{aligned}
F & =g(1-p) M \\
\Delta F & \approx M(1-p) \Delta g+g(1-p) \Delta M-g M \Delta p
\end{aligned}
$$

## Accounting for change

$M$ is Indian market cap (in dollars)
$p$ is insider shareholding
$g$ is fraction of outsider shareholding with foreigners
$F$ is dollar value of foreign shareholding.

$$
\begin{aligned}
F & =g(1-p) M \\
\Delta F & \approx M(1-p) \Delta g+g(1-p) \Delta M-g M \Delta p
\end{aligned}
$$

$M(1-p) \Delta g \quad$ Traditional home bias explanations
$g(1-p) \Delta M \quad$ Response to bigger $M$
$-g M \Delta p \quad$ Stulz effect.

## Indian experience

| Year | For. own. <br> (fraction of <br> outsider) | Insider own. <br> (fraction of <br> total) | Market capn. <br> (Trn. Rs.) | For. mktcap. <br> (Trn. Rs.) |
| ---: | ---: | ---: | ---: | ---: |
| 2001 | 0.1526 | 0.4421 | 5.32 | $\mathbf{0 . 4 5}$ |
| 2002 | 0.1452 | 0.4403 | 6.41 | 0.52 |
| 2003 | $\mathbf{0 . 1 1 9 5}$ | $\mathbf{0 . 4 2 0 9}$ | 6.30 | $\mathbf{0 . 4 3}$ |
| 2004 | 0.1923 | 0.4740 | 11.90 | 1.20 |
| 2005 | $\mathbf{0 . 2 3 2 8}$ | $\mathbf{0 . 5 2 1 7}$ | 16.40 | $\mathbf{1 . 8 2}$ |

## Decomposition of $\Delta F$

(Billion rupees)
Components

| Year | Traditional | ICAPM | Stulz | Discrepancy | $\Delta F$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 2002 | -26.62 | 89.33 | 1.68 | -4.44 | 68.83 |
| 2003 | -93.86 | -7.72 | 14.59 | -1.82 | -85.18 |
| 2004 | 455.62 | 566.03 | -121.36 | 132.86 | 767.41 |
| 2005 | 317.43 | 500.86 | -182.30 | 14.11 | 621.88 |

## Implications for our exploration

- The massive jump from 2003 to 2006 was not caused by a 'Stulz effect' - if anything this was playing against a rise in foreign ownership.
- Roughly half of the story lies in a bigger $g$ - a bigger fraction of outside shareholding being purchased by foreigners.
- We must explain why $g$ changed.

## Part II

## Explaining changes in the fraction of outside shareholding held by foreigners, utilising firm-level data

## Cross-sectional variation

- If foreigners were country-picking, they would buy index portfolios
- $g$ would be the same across firms
- The data vehemently disagrees.
- There is massive firm-variation in $g$
- Foreigners are very picky about what firms they invest in.

## The zero-foreign-ownership phenomenon

- Suppose $g$ is zero
- In $F=g(1-p) M$, changes in $p$ or $M$ stop mattering as long as the firm is not even off the starting line.
- The ICAPM effect and the Stulz effect are not operative as long as $g \approx 0$.

We define 'zero foreign ownership' companies as those with $g<0.05$.

## Number of firms

| Year | Zero | Nonzero | Total |
| :--- | ---: | ---: | ---: |
| 2001 | 670 | 398 | 1068 |
| 2002 | 733 | 358 | 1091 |
| 2003 | 768 | 338 | 1106 |
| 2004 | 663 | 459 | 1122 |
| 2005 | 522 | 636 | 1158 |
| Sums | 3356 | 2189 | 5545 |

## Market capitalisation of zero-ownership firms

| Year | Non-zero | Zero | Total | Share |
| ---: | ---: | :--- | ---: | ---: |
|  | Market capitalisation (Rs. Trn.) | $(\%)$ |  |  |
| 2001 | 4.18 | 1.13 | 5.32 | 78.57 |
| 2002 | 4.73 | 1.68 | 6.41 | 73.70 |
| 2003 | 4.31 | 1.99 | 6.30 | 68.37 |
| 2004 | 9.61 | 2.28 | 11.90 | 80.77 |
| 2005 | 13.87 | 2.52 | 16.40 | 84.56 |

## Transition probabilities between zero and non-zero foreign ownership

|  | Zero | Non-zero |
| :--- | ---: | ---: |
| Zero | 0.8599 | 0.1401 |
| Non-zero | 0.1255 | 0.8744 |

## Our story

(1) Firms must have certain characteristics in order to internationalise shareholding
(2) There is a selectivity process which determines which firms make it into the investment universe of foreign investors
(3) Once a firm is in this universe, foreign investors choose $g$, the fraction of outside shareholding that they buy.

## A Tobit-2 or Heckman-style model.

$$
\begin{aligned}
y^{*} & =\beta^{\prime} X+e_{1} \\
y & =1 \quad \text { if } \quad y^{*}>0 \\
g & =\gamma^{\prime} W+e_{2} \quad \text { if } \quad y=1 \\
\binom{e_{1}}{e_{2}} & \sim N\left(\left[\begin{array}{l}
0 \\
0
\end{array}\right],\left[\begin{array}{cc}
\sigma_{1}^{2} & \rho \sigma_{1} \sigma_{2} \\
\rho \sigma_{1} \sigma_{2} & \sigma_{2}^{2}
\end{array}\right]\right)
\end{aligned}
$$

## Setting up the model

- Model nonlinear response in size and liquidity using orthogonal polynominals
- Estimation by MLE
- Identical model for both foreign institutional investors and domestic institutional investors.

## What firms make it?

|  | Foreign II |  |  | Domestic II |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | Coef. | $t$ |  | Coef. | $t$ |
| Intercept | -2.0289 | -31.23 |  | 0.2815 | 4.15 |
| is.SOE | -0.5812 | -5.06 |  | 0.5858 | 2.44 |
| Lagged returns | -0.0007 | -3.94 |  | -0.0011 | -6.10 |
| Poly(turn. ratio, 1) | 17.8548 | 11.43 |  | -2.1724 | -1.02 |
| Poly(turn. ratio, 2) | -8.4001 | -5.29 |  | -0.5654 | -0.28 |
| Log market cap. | 0.4379 | 29.41 |  | 0.2569 | 14.21 |
| E/P | -0.2624 | -6.27 |  | -0.4059 | -7.13 |

## How much shareholding?

|  | Foreign II |  |  | Domestic II |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | Coef. | $t$ |  | Coef. | $t$ |
| 2001 | 11.0598 | 8.12 |  | 22.0609 | 32.06 |
| 2002 | 10.6447 | 7.46 |  | 21.2883 | 30.58 |
| 2003 | 10.0244 | 7.29 |  | 21.2472 | 30.31 |
| 2004 | 11.8753 | 8.88 |  | 16.0666 | 22.43 |
| 2005 | 11.8191 | 9.02 |  | 11.7231 | 15.92 |
| Poly(Out., 1) | -22.5563 | -1.08 |  | 13.8626 | 0.71 |
| Poly(Out., 2) | -60.2356 | -2.84 |  | -60.8253 | -3.09 |
| Poly(Out., 3) | 24.3799 | 1.16 |  | -178.3963 | -9.39 |
| Poly(Lmkt., 1) | 151.9899 | 3.20 |  | 381.4702 | 17.01 |
| Poly(Lmkt., 2) | 236.7690 | 9.48 |  | -18.3270 | -0.94 |
| Poly(Lmkt., 3) | -47.9569 | -2.49 |  | -104.7732 | -5.43 |
| Debt/equity | -0.3831 | -2.04 |  | 1.5036 | 8.78 |
| $\sigma$ | 12.4025 | 52.39 |  | 17.6565 | 83.08 |

## Key findings

- The selectivity process emphasises: SOE, contrarian investment, liquidity, size, E/P.
- There are selectivity effects for both foreign and domestic institutional investors.
- $g$ is influenced by : Nonlinear response to outside shareholding, nonlinear response to size, leverage.
- Foreign institutional investors think very differently from domestic institutional investors. (Differs from Dahlquist \& Robertsson, 2001).

## Nonlinearity in outside shareholding

## Nonlinearity in size

## What changed?

- A major factor influencing the phenomenon of interest was the rise in $g$ from 11.95\% in 2003 to 23.28\% in 2005.
- After controlling for firm characteristics, the year dummies show: 10.02 in 2003 and 11.82 in 2006.
- The bulk of the change in $g$ is explained by changes in firm characteristics.

## Summary

Why did the $F$ rise by roughly 13 times in 4 years?
(1) Stulz effect: was exacerbating home bias.
(2) A decomposition of changes in F: The change in 2005 was: -29\% the 'Stulz effect', $+81 \%$ the increased market capitalisation of local firms, $+51 \%$ a bigger $g$.
(3) The phenomenon of zero-foreign-ownership firms. There was a substantial decline in this problem between 2003 and 2005.
(1) A Heckman-style model: Model selectivity and propensity using firm characteristics.
(0) Firm characteristics, not country characteristics: After controlling for these firm characteristics, year fixed effects have little year-to-year fluctuation.
The surge of foreign investment into India was largely about modified firm characteristics.

## Thank you.
